Theme-day Morphodynamics of the Wadden Sea, 17 May 2019

GOAL: SYSTEM KNOWLEDGE & MODELLING TOOLS

VARIETY OF USER FUNCTIONS

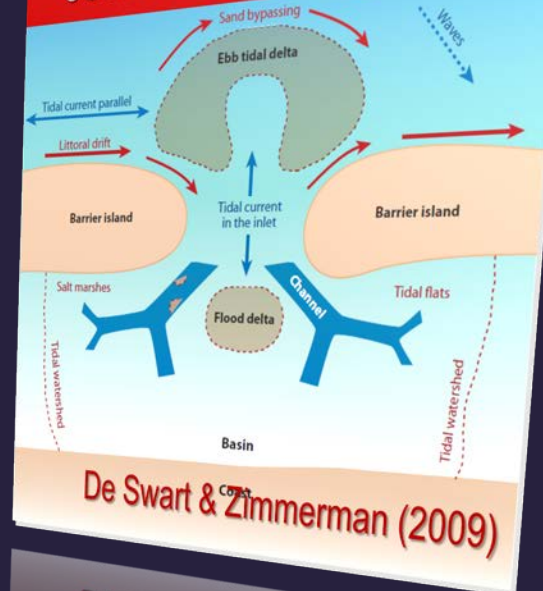

MANAGEMENT CHALLENGES

- Policy shift allowing for more natural behaviour (PRW, 2014)
- Climate change
- Conflicting user interests

COMPLEX NATURAL SYSTEM

COUPLING OF SCALES

QUESTION: INFLUENCE OF BASIN SHAPE ON BARRIER COAST DYNAMICS?

METHOD: IDEALIZED MODELLING

QUESTION: INFLUENCE OF BASIN SHAPE ON BARRIER COAST DYNAMICS?

Google Earth

METHOD: IDEALIZED MODELLING

BARRIER COAST MODEL (1/2)

- Meso-tidal barrier coasts (Roos et al., 2013)
- Geometry: outer sea, inlets and basin
 - NEW** Arbitrary plan view shape of basin
- Morphodynamics: inlet evolution only
 - Tidal amplitude U vs U_{eq} (Escoffier, 1940)
- Hydrodynamics: idealized process-based
 - Linearized shallow water equations
 - Radiative damping from inlets
 - Forced by tidal wave in outer sea

BARRIER COAST MODEL (2/2)

- Outline of simulations
 - Start with large number of inlets
 - Simulate evolution to equilibrium
 - Analyze properties of equilibrium
 - Create ensemble by randomizing initial inlets

NEW

Influence of plan view shape of basin

- Metric: sum of inlet widths (wide, narrow, total)
- Systematically vary B_{wide}
- Example of human intervention: basin reduction

EXAMPLE SIMULATION

A: Initial configuration

B: Evolution

C: Equilibrium configuration

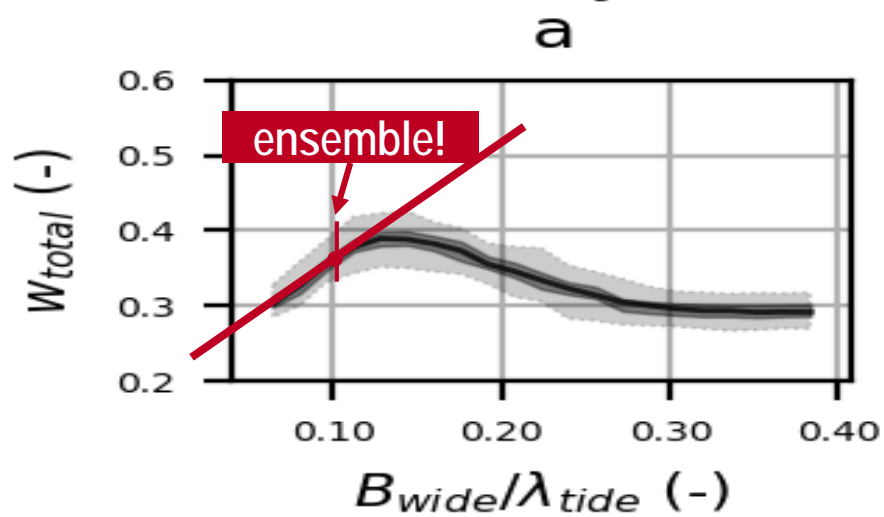

MODEL RESULTS

- Metric: sum of inlet widths per km barrier coast
 - For entire barrier coast: w_{total} (vertical axis)
- Plotted against basin width in wide part
 - Scaled vs tidal wavelength: $B_{\text{wide}}/\lambda_{\text{tide}}$ (horizontal axis)

MODEL RESULTS

- Metric: sum of inlet widths per km barrier coast
 - For entire barrier coast: W_{total} (vertical axis)
- Plotted against basin width in wide part
 - Scaled vs tidal wavelength: B_{wide}/λ_{tide} (horizontal axis)

MODEL RESULTS

- Metric: sum of inlet widths per km barrier coast
 - For entire barrier coast: W_{total} (vertical axis)
- Plotted against basin width in wide part
 - Scaled vs tidal wavelength: B_{wide}/λ_{tide} (horizontal axis)
- Same for wide and narrow part only: W_{wide} , W_{narrow}
- Plan view basin shape affects equilibrium
 - More inlets in the wider part
 - Inlets in narrow part also affected → interaction!
 - Resonant response (with damping)
